A Critical Companion to Posthumanism and Digital Humanities

Intersectional Insights: Disability, Fandom and Performance in the Digital Humanities

S Viji & B Jeevasri
Department of Electronics & Communication, Vaigai College of Engineering, Madurai

Abstract

Digital Humanities is an interdisciplinary field that combines the technologies with traditional humanities disciplines such as history, literature, linguistics, cultural studies with the use of digital [illegible] leverages technology to explore [illegible] experience. However, every ability [illegible] some disability. It was found that not everyone is able to access web platforms or visit cultural sites easily. In the context of fandom, digital humanities can be used to analyse and explore fan cultures, fan fiction, fan art and other aspects of fan communities. The performance of digital humanities plays a vital role in showcasing the effectiveness of a various aspects and allow us to analyse computationally.

As students who have been a part of this ongoing expeditious generation, pondering about digital humanities and its inter related effects became our daily routine. As much as the rapidly growing technologies seems welcoming, we humans need to be meticulous in time in order to make it a thriving one. By the means of this paper the delicacy of embracing new technologies in the human race was discussed from end to end. This explores the dynamic interplay between technology, disability and fan culture, paving the way for more equitable and engaging digital spaces. Our research paper has the potential to drive positive changes in how disability is represented and experienced by accessing digital platforms significantly.

Keywords: *Digital humanities, fandoms, disabilities and performance*

Digital humanities, a term that deals with humanities computing that attempts to combine the technologies with certain traditional humanities such as history, literature, cultural studies with the use of digital tools and software platforms. This interdisciplinary field defines the study of humans whether it be through art or government, technology and everything in between.

The dynamic field of DH leverages the technologies to explore and even communicate insights about the human experience by taking multi perspective course of action. It paves the way for providing the environment and tools for producing, curating and interacting with the knowledge that is *'born digital'* and lives in various digital contexts. It can be used to train the society, improvise job opportunities and to upskill the humans in order to instil solutions for futuristic problems. The Digital tools can be used to understand the *socio-economical hitch* in a better way for various scenarios. It emphasises the usage of digital tools, methods and web platforms for enhanced comprehension, communication. DH also advocates for environmental injustice and unsustainability in the current era of rapid developments and shifting environments.

Digital humanities have the inclusion of intermediate fields such as digital medical or health humanities which deals with the exploration of medicines, health care, and humanities using digital tools and technologies in order to embrace the medical field's cumbersome *in hierarchical structures* and provide respective solutions. In History and philosophy humanities, DH aids in text mining, analysis of large data sets and creating interactive visualizations to obtain newer perceptions into historical events. Digital humanities can also used in the analysis of philosophical texts, facilitating research and increasing the accessibility of philosophical ideas. Overall the digital humanities tools, methods can enhance the teaching, research and dissemination of knowledge in these disciplines.

In the field of art and music, digital humanities include the usage of technology to preserve, analyse and enhance the artistic and musical understanding of its correlated works. This includes using digital tools and methods in applications such as Digital archives and Data analysis, Augmented reality and virtual reality to increase the immersive experiences of art works, Digital preservation to ensure the longevity of fragile art and music, Music information retrieval for organizing large data bases, Computational art and music helps to blur the lines between the machine generated content and human creativity.

Bridging the Digital Divide - Disability in Digital Humanities

Every ability comes hand in hand with some disability of its own. Despite the various enhancements that are done by the digital humanities in the current era, it was found that not everyone is able to access the digital tools, applications, smart devices, web platforms and online sites easily. This ignites the various concerns in digital humanities that revolves around its correlated disabilities.

The UN convention on the rights of persons with disabilities implies that *the* "persons with disabilities include those who have long – term physical, mental, intellectual or sensory impairments which in interaction with various barriers may hinder their full and effective participation in society on an equal basis with others"
